Currently for district heating networks the preinsulated pipes are most widely used. The main advantages of preinsulated pipes are:

- minimal heat losses;
- long service life (30-50 years) with minimal maintenance demands;
- simple assembly of joints, providing efficient thermal insulation and waterproofing;
- concrete duct is not necessary, pipes are laid in the trench on sand layer;
- electronic moisture surveillance system is available.

“POLIURS” Ltd. has specialized in the production of preinsulated pipes for district heating since January, 1995. Special attention is devoted towards high quality of the product and protection of surrounding environment. Developed quality system is certified according to standards ISO 9001 and ISO 14001. Introduced ISO 9001 and ISO 14001 Quality Management Systems ensure that the products of “POLIURS” Ltd. are manufactured according to the European standards:

- EN 253. District heating pipes - Pipe assembly of steel service pipes, polyurethane thermal insulation and outer casing of polyethylene.
- EN 448. District heating pipes - Fitting assemblies of steel service pipes, polyurethane thermal insulation and outer casing of polyethylene.
- EN 488. District heating pipes - Steel valve assembly for steel service pipes, polyurethane thermal insulation and outer casing of polyethylene.
- EN 489. District heating pipes - Joint assembly for steel service pipes, polyurethane thermal insulation and outer casing of polyethylene.
- EN 13941-1. Design and installation of thermal insulated bonded single and twin pipe systems for directly buried hot water networks - design.
- EN 13941-2. Design and installation of thermal insulated bonded single and twin pipe systems for directly buried hot water networks - installation.
- EN 14419. Surveillance system.
- EN 15698-1. Twin pipe systems, Part 1: Factory made fittings
- EN 15698-2. Twin pipe systems, Part 2: Factory made fittings and valve assemblies

In addition to traditional products described in catalogue “POLIURS” Ltd. offers individually designed pipes and fittings on the customer demand. Individual solutions can remarkably reduce the volume of installation works and the expenses required. Company’s staff consults customers in all aspects regarding optimal choice of pipe installation.

A preinsulated bonded pipe for district heating is a sandwich construction consisting of three main components:

- a steel service pipe;
- an insulation of polyurethane foam (PUR);
- an outer casing of high-density polyethylene (HDPE).

“Poliurs” Ltd. produces preinsulated bonded pipes and their fittings with diameters of main service pipes from 20 to 1000 mm (3/4 - 39 inches). Depending on diameter of used casing pipe for each service pipe 4 different thicknesses of foam insulation layers are possible, 4 insulation series.

“Poliurs” Ltd. also produces preinsulated pipes and fittings for special application:

- preinsulated pipes and fittings with galvanized spiral steel casing;
- pipes and fittings with two-layer insulation for temperatures 150 - 250°C;
- preinsulated double pipes and fittings, where under one casing are located two pipes: preheated and return pipes;
- preinsulated pipes with heating cable.

Preinsulated pipes are equipped with alarm system wires that certify pipeline correspondence to the technical specifications when it becomes operational, also makes an operator known in case of a potential accident and discovers its exact location. The surveillance of the pipeline can be automatically. Assortment of preinsulated pipes and fittings enables to construct pipeline in complicated geographical region (including overcoming of water barriers) and in the cities.

On costumers' request, the company can supply fittings of the individualized construction.

Different technical ways and means are offered for compensation of thermal expansion deformation and its effect decrease.

The company meets the customers' needs concerning additional materials for the assembly of pipeline and fittings.

Company consults and train clients of necessary rules regarding pipe assembly, and offers technical surveillance of the pipeline installation (during assembly and acceptance of the pipeline).

The company "POLIURS" Ltd. Quality Management System correspondingly to ISO 9001 demands includes all structural entities and staff, which are connected to the production of the heat insulated products and client relationship. The company uses only certified resources for production of pipes, fittings and its accessories. The staff of the company is qualified and certified. All main parameters of the production process are controlled and recorded; staff involved in the production is also registered. That way high level of responsibility is achieved. The personal responsibility for one's own duties is the main guarantee of the company's production.

ISO 9001 and ISO 14001 have been proved and certified by "Bureau Veritas Quality International" that is the leading world firm in certification.

"POLIURS" Ltd. guarantees that the operational time of the manufactured preinsulated bonded pipes and joints is 5 (five) years, if following conditions are fulfilled:

- comply with instructions for transportation, storage, assembly and operation, which are included in "Heating main montage instructions CV4.04."
- ensures following pipeline parameters:
  - working pressure ≤ 16; 25 bar;
  - temperature ≤ 140°C;
  - salinity < 3000 mg/l;
  - pH 9,5 -10;
  - free oxygen not permissible.

The company "POLIURS" Ltd. provides its consumers with the special quality certificate on all their products.

"POLIURS" Ltd. is constantly working on widening its assortment of produced items, improving product quality and offered services.

RISE tests our products once per year on the basis of the functional requirements in EN 253, EN 448 and the Euroheat & Power certification guidelines.

All steel service pipes, pipe casings and insulation material used in assembly of preinsulated pipes and fittings comply with European Standard - EN 253.

Main parameters:

1. Steel service pipe:

- nominal diameters DN: 20 - 1000 mm;
- steel grades P235GH EN 10217-2;
- upper yield strength, min: 235 MPa;
- tensile strength, min: 360 - 500 MPa.

**Series 1, 2, 3 and 4**

Steel service pipe is covered by a plastic foil every second meter along the entire pipe length. This arrangement allows easy removal of the foam from the steel in the sections which are indicated on the outside casing pipe. Whole lengths or parts of pipes cut-to-length can be installed at any place.

L1 segments can be ordered on 6; 12; 16; 18 m long pipes.

Pipes with protectors are used in closed canals (pipes) – under the road or buildings.  
Minimal protector count per pipes is 2 pcs.

Depending on preinsulated pipe length you can choose distance between protectors:  
 $L_2 = 1.0 - 1.5\text{m}$  and  $L_3 = 2.0 - 3.5\text{m}$ .

Pipe reducer can be ordered with reduction between 1-3 dimension levels.

Diameter of branch **L2** cannot be greater than the diameter of main pipe.

On request T-pieces can be produced with any angle of branch pipe to the main pipe.

When ordering it is mandatory to inform of T-piece preference: right or left. On the drawing the T-piece is shown with left transition.

4.	Polyurethane foam components «A»&«B»*	2
5.	PE venting cork D26 **	2
6.	PE welding cork **	2
7.	FOPS patches	2

Note:

\* Depending on the order, PUR foam components "A" and "B" are packed in small volume containers with quantities per compound;

\*\* PE welded corks (station 6) are welded in after the filling up of the joint with PUR foam.

Foam pads are placed to capture deformation of thermal elongation of the straight pipeline. Pads are produced from flexible material.

Foam pads are placed at the end of straight pipe segments on the outer and inner side of the fitting and are strengthened using duct tape, cord, or any material of such sort.

Foam pads are cut by outer diameter of pipe casing:

Diameter of PE casing [mm]	Width of pad C [mm]	Diameter of PE casing [mm]	Width of pad C [mm]	Diameter of PE casing [mm]	Width of pad C [mm]
90	143	225	300	500	715

End cap is heat-shrinkable product that has cylindrical gradually degreasing shape.

End cap is placed at pipe ends to seal PUR insulation after entering buildings, foundation or canals.

End cap are used for one preinsulated steel pipe as well as for preinsulated twin steel pipe system.

End caps are used for preinsulated pipes with heating pipe temperature not exceeding 135°C.

End plugs are used for sealing preinsulated pipe ends that can be extended in the future.

PE sleeve connection to end plug and pipe casing is secured using heat-shrinkable tape. Space under the PE sleeve is filled with rock wool or foam.

Wall entry rings are used where pipes pass through walls or floor entries to prevent the penetration of ground water in buildings. Rings are made from special rubber profile resistant to ageing.

Location of the F802 in concrete If holes is to be drilled in the concrete wall for later embedding of pipes/rubber ring in concrete.

Recommend min. drill holes:

HDPE 40 – 180	Jacket dim.	+ 100 mm
HDPE > 200	Jacket dim.	+ 120 mm

Position between the wall and pipe

When mounting in other types of holes, there should be a clear space above the rubber ring of 20 mm.
